HOW TO EMBED KANOPY VIDEOS INTO MOODLE:
A STEP-BY-STEP GUIDE.

1: The first thing needed is access to Kanopy: https://stmartin.kanopystreaming.com.

2: Once on the platform, select a video you wish to embed. This is a screenshot from the front page of Kanopy.

3: Click on the video you wish to embed. For this demonstration, we’ll use the circled video.
4: After clicking on the embed button, it will bring up the code you’ll need to copy, as well as some options you can select. Select the options before copying the code, as the sizes will affect the code. When you’ve got your size, highlight all the text within the embed area and copy it.

5: It’s now time to go to Moodle. You can embed media almost anywhere in Moodle that you can write a description for something. This includes weekly headings, assignments, descriptions of anything (including syllabi), or in forums. To demonstrate, let’s select the cog under a weekly heading. (Note that you do have to turn on editing on your Moodle page to access the editing features—the button is at the top right of your Moodle page.)

6: Clicking on the cog will take you to the description page. This allows you to describe that area, but it also allows you to insert media or embed videos. In this case, we already have our embed code copied, so we just need to be able to put it in the box. We need to click the “Show more buttons” button first to give us our options.
7: After the more options come up, we now need to be able to enter the code properly. For that, we need to click the “HTML” button.

8: Paste the embed code in the text box, then click the “Save changes” button. Now you should see your video from your main course page!

9: Congratulations, you’re done!
